

# ECS to Apparatus (Glossary)

Apparatus provides all of the basic ECS idioms and even more. To be unambiguous (and self-sustained, actually) our framework uses a different naming scheme as compared to the classic ECS. Here is the list of analogous terms:

ECS Term	Apparatus Term	Description
Entity	Subject & Subjective (Entities)	The Trait/Detail container.
Component	Detail & Trait (Components)	The composing data blocks.
System	Mechanic	The details processor.
A group of Systems	Mechanism	A larger group of detail processors.
Archetype	Fingerprint	The subject's current state.
Chunk	Belt & Chunk	The details & trait storage.

## Reasoning (Rationale)

Why did we chose the non-conventional naming scheme in the first place? Well, we obviously consider ours to be a better choice 😎.

Look for yourself. “Entity” is a much broader term, that’s usually reserved in the engine’s ecosystem to some general-purpose objects and is useful for general documentation. “Subject” is in turn better associated with something that operates on them (i.e. Mechanics). The word “system” is also so much broader and could denote almost anything, e.g. particle system, save/load system, system library, etc. “Mechanic” is clearly something very deeply related to ticking and game design as a whole. As of “component” – it’s basically already reserved by Unreal Engine 🤖 itself. “Detail”/“Trait” are free to use and are quite obvious to be a part of something.
